OPERATIVE DETAILS

Procedure	Laparoscopic appendectomy under general anaesthesia
Date / Time	25 April 2026 at 21:30
Duration	42 minutes
Findings	Inflamed, non-perforated appendix with fibrinous exudate. No perforation. Peritoneal lavage performed.
Blood Loss	Estimated <50 mL
Complications	None intraoperative

DISCHARGE MEDICATIONS

Medication	Dosage	Frequency	Purpose
Amoxicillin-Clavulanate	625mg	3x daily for 5 days	Antibiotic to prevent infection after surgery
Ibuprofen	400mg	3x daily as needed	Pain relief
Omeprazole	20mg	Once daily	Protects stomach lining from pain medication side effects

FOLLOW-UP INSTRUCTIONS

Outpatient Review	In 2 weeks — wound check and histopathology results
--------------------------	---

Restrictions	No heavy lifting (>5 kg) for 4 weeks. No driving for 1 week. Shower only until wound review.
Return to ED if	Fever >38.5 deg C, increasing abdominal pain, wound redness or discharge

PATIENT-FRIENDLY SUMMARY

Patient-Friendly Summary

Priya Sharma, a 28-year-old woman, was admitted with appendicitis — an inflamed appendix that needed emergency removal. The surgery was done using a keyhole (laparoscopic) technique with 3 tiny cuts and completed in 42 minutes without complications. She recovered well over 3 days in hospital, eating and walking normally before discharge. She has been sent home with a short course of antibiotics and pain relievers. She needs to avoid heavy lifting for 4 weeks and return in 2 weeks for a wound check.
