Department of Clinical Services | Pune, Maharashtra

Radiology Report — Chest X-Ray (PA + Lateral)

Radiology Department | 30 April 2026

Patient Name	Anita Desai	Age / Gender	67 Years / Female
Date of Birth	03 November 1958	Radiologist	Dr. Ramesh Pillai, MD (Radiology)
MRN	40089012	Report Date	30 April 2026

CLINICAL INDICATION

Persistent cough x6 weeks, low-grade fever, unintentional weight loss (~4kg in 2 months), night sweats. Ex-smoker (20 pack-years, quit 10 years ago). Rule out pulmonary pathology.

IMAGING FINDINGS

Right Upper Lobe	2.8 cm irregular spiculated opacity, posterior segment. Irregular lobulated margins, pleural tethering. No satellite nodules.
Left Lung	Clear. No consolidation, effusion, or nodules.
Hilar Region	Right hilar fullness — mild enlargement. Possible right hilar lymphadenopathy.
Pleura	No pleural effusion bilaterally. No pneumothorax.
Cardiac Silhouette	Mildly enlarged (CTR 0.54). Prominent aortic knuckle — age-appropriate.
Trachea	Midline. No deviation or compression.
Bones	Mild thoracic kyphosis — age-appropriate. No lytic or sclerotic lesions.

IMPRESSION

Test / Parameter	Result	Reference Range	Status
RUL Spiculated Opacity (2.8cm)	Highly Suspicious	No abnormal opacities	CRITICAL
Right Hilar Enlargement	Mild — Possible LN	Symmetrical hila	ABNORMAL
Cardiothoracic Ratio	0.54	<0.50	HIGH

IDENTIFIED RISK FACTORS

Risk Factor	Explanation
Lung cancer — high likelihood	Spiculated opacity with pleural tethering is classic for primary bronchogenic carcinoma
Regional lymph node spread	Right hilar enlargement may represent nodal involvement — CT staging required urgently
Risk of delayed diagnosis	Symptoms present for 6 weeks — urgent workup is time-critical

RECOMMENDATIONS

URGENT (within 1 week)	CT Chest with IV contrast + PET-CT scan for staging. Urgent oncology referral.
Additional Workup	Sputum cytology x3, bronchoscopy with BAL and biopsy, CT-guided needle biopsy if required.

Alert	Findings communicated verbally to referring physician Dr. Suresh Patel on 30/04/2026 at 15:42.

PATIENT-FRIENDLY SUMMARY

Patient-Friendly Summary

Mrs. Anita Desai, a 67-year-old woman and former smoker, had a chest X-ray for persistent cough, weight loss, and night sweats. The X-ray found a 2.8 cm shadow with irregular, jagged edges in the upper part of her right lung — the radiologist says this is highly suspicious for lung cancer. Nearby lymph nodes also appear swollen. This is not a confirmed diagnosis yet, but it is a very serious finding that requires urgent follow-up with a CT scan, PET scan, oncology consultation, and likely a biopsy.
